Windmill

Improved Web UI Testing.

What is Windmill

- A Framework for testing Web Applications like COSMO!

- Like Selenium, except solving many frustrations resulting from their process

- Nearing their features from the ground up in less than two months

Current Functionality

- Click, DoubleClick, Urls & Javascript , Typing (form interaction), Verification

- Select, Radio Buttons, Drop Down Boxes

- Performance, Logging, Reporting

- All features fully functional in IE6, IE7, Safari 2, Firefox 1.5 & 2

Improvements

- Tests are written in JSON, multiple ways to run them. (console, shell, suite)

- Results and Timing are sent back to the service to analyze later

- New actions aren't executed until the current one is finished (avoid timeout)

- On failure, the service is paused allowing you to step in and poke around.

Demo

- A super cool demo.

Future

- Fix (currently broken) drag and drop functionality.

- Full spec query string support

- A UI recorder

- DOM overlay

- Community contributions
